

## OVOPAL XC PALLETISER OF CASES AND BOXES

**OVOPAL XC** is a range of robotised palletisers to process the cases and open-top cases used in the packaging of eggs. Thanks to grabbers we have developed specially, **OVOPAL XC** can palletise up to 4 products simultaneously. We have a specific grabber for the open-top cases and a mixed American case and box grabber. Each of the “heads” ensures the taking and positioning of empty pallets and dividers when necessary.

**OVOPAL XC**, through its programming specially designed for your applications, therefore makes it possible to take and position the empty pallets, take and palletise the parcels in compliance with your palletising systems, and insert dividers according to your requirements.

Conveyors for automatic evacuation of full pallets are also provided to remove the products from the secure zone. The pallets can also be directed by conveying to an automatic shrink wrapping machine, coupled with a scan of all parcel labels in real time.

**OVOPAL XC** enables you to significantly optimise your productivity with high quality and reliability and to limit strenuousness for your operators. Additionally, we offer you simple production management and control via a touch-screen. Recording of data, gencod and links with your tracking software enable you to track the products, recording and printing of pallet labels.

*NB: With a constant desire to improve our equipment, modifications may be made*
